

# Reflective Essay of this week's class of Introduction to Digital Humanities

This week's class was full of new learnings and information. In this week we get to learn about new digital platforms like **SLACK, TIMELINE, GITHUB**. In this week professor also gave us project of making the website of our subject for publishing our blogs and newsletters online.

In SLACK we made our account there with our credentials, and we formed our IDH group on slack, which we use now for communication and notes sharing purpose. SLACK is digital platform like WhatsApp which can be used for communicating and sharing content.

TIMELINE is platform where we can publish our researched data by filling it in google sheet format with respect to the year and dates, the TIMELINE will arrange all this data in ascending order of the time and years. And it will show all this data like a story of evolution of that specific data we published. We can also add images and some notes describing about that topic. Learning about this TIMELINE and publishing the data was really an interesting and fun work

We also learned few more techniques about GITHUB this week by posting our assignments, getting access to the resources uploaded on GitHub.

And a main task or new learning for me in this week was to participate in the project of building our Digital Humanities website. I was assigned with the task of creating a website with help of coding using HTML, CSS, JS. Dealing with this coding languages for first time was an interesting but also hard task for me. But I was very enthusiastic about this project, and I started learning the HTML for this project. And also created the homepage and basic alignment of our website. And I'm still working on this project, which will be completed in next few weeks.

We also had informational session on E-Literature by research scholar Samya Brata Roy from IIT Jodhpur. In this informational session he gave us information about E-Literature field and shared his own views on this field. And he also shared his research on which he is working right now. He also shared his fascination about video games and how he applied this in his research work.

Overall, this week was full of interesting stuff and informative learnings which was new for everyone. And these new learnings will help us in our further studies in our course.
